Purpose and funcionality

"Estimated Delivery Time" is a module developed by 4webs that will allow you to specify to your customers the date on which they will receive their orders in a simple and automatic way.

In principle, you will have the possibility of defining a maximum delivery time based on the working hours of your transport company.

On the other hand, you will find the option to set a default delivery time for all your products. This time can be individually edited for each product from its catalog, defining a specific time for each carrier.

Also, this module will allow you to create a table of holidays in which there is no distribution, so that the module does not count them when determining the delivery time.

On the other hand, you can also customize the appearance of the block that shows the delivery time in the front-end of your online store, thanks to the color selectors that you will find in the configuration options of the module.

In the same way, you can also activate the advanced options, so that the module will consider the specific configuration of each of your carriers to show the delivery time according to which it is selected.

Technical description and requirements

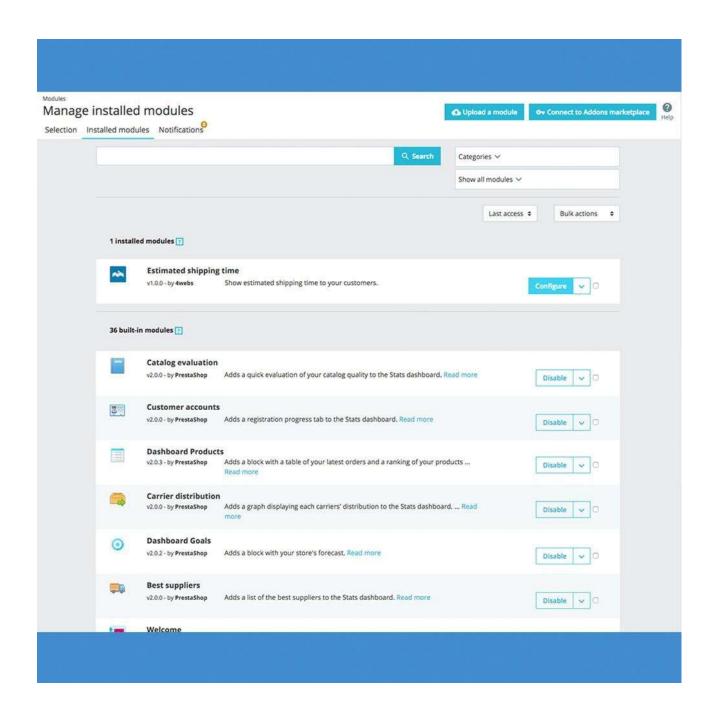

VERSION: 1.0.0

COMPATIBILITY: v1.5.0.0 - v1.7.3.3

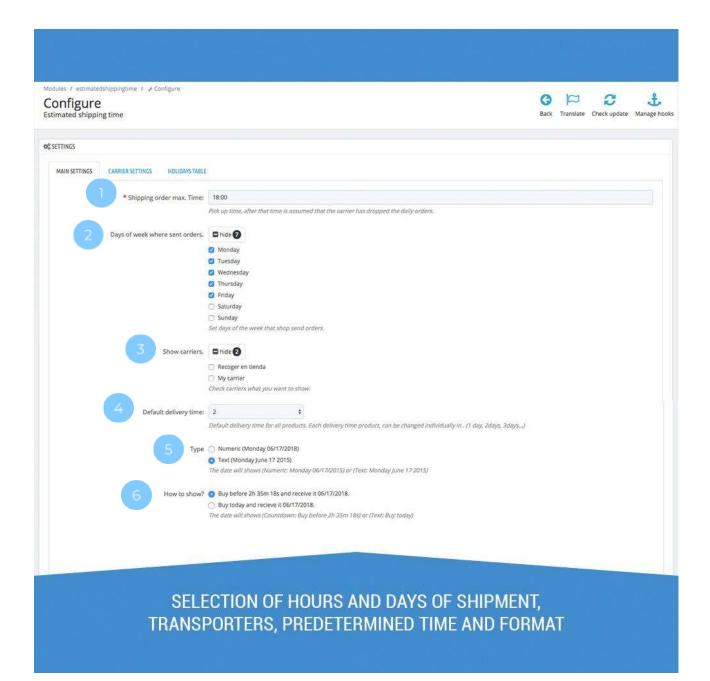

Installation and configuration

First, it is necessary to upload the module to the server. Later, you can find it in your module search and click on the "Install" option. You can also access it in a faster way through the "Orders" section, in which you will find it integrated.

Next, are shown different screenshots that graphically explain the simple setup process of "Product Icon Tag". Once installed, locate the module at your Prestashop list and access to your choices via the "Configure" button showed in the image below.

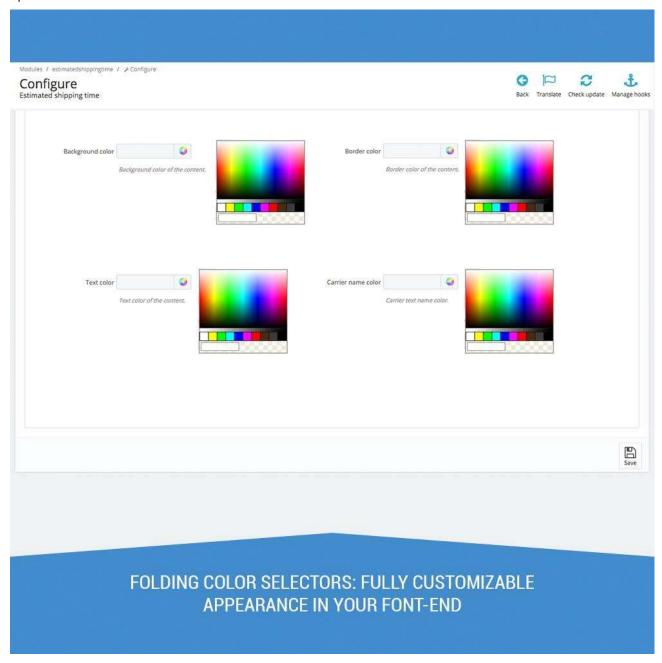

Once inside the options of the module, you will find the first screen of "Main Settings", where you can modify all the parameters defined below.

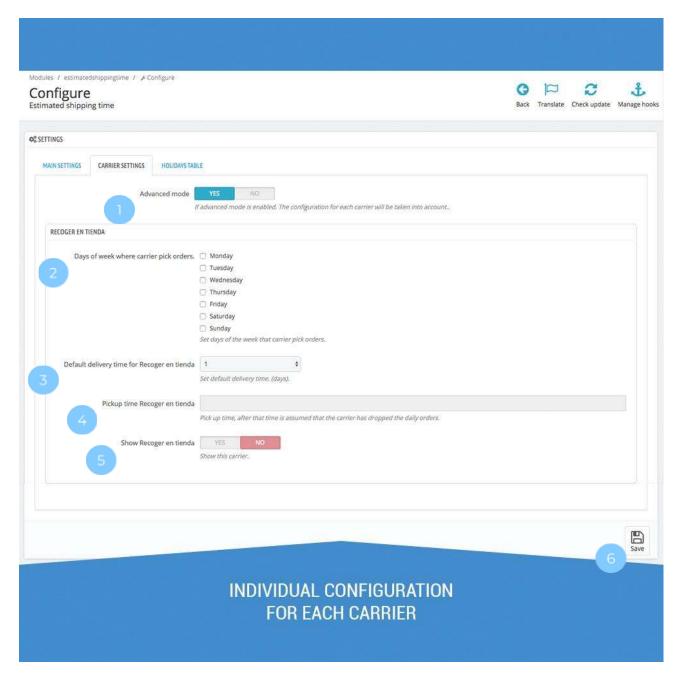

- 1. Determine here the maximum time at which the products that have been purchased will be picked up from your store by the carriers.
- 2. Mark the days of the week in which shipments are made.
- 3. Select the carriers you want to make available to your customers.
- 4. Set, in number of days, a predetermined delivery time of your products. Afterwards, you can modify this time individually for each product, according to the carrier, from your "Catalog" section. See how to do it on page 9 of this manual.
- 5. Decide here if you want the delivery date to be displayed in its front-end in numerical or textual format.
- 6. Select the phrase that will define the delivery date in the front-end.

Continuing in this same screen of "Main Settings", you will find the drop-down ones that are shown in the

lower screenshot. These will allow you to determine the background and border colors of the delivery time frame on your front-end, as well as the color of the text and the name of the carrier. Do not forget to save the options defined in this tab.

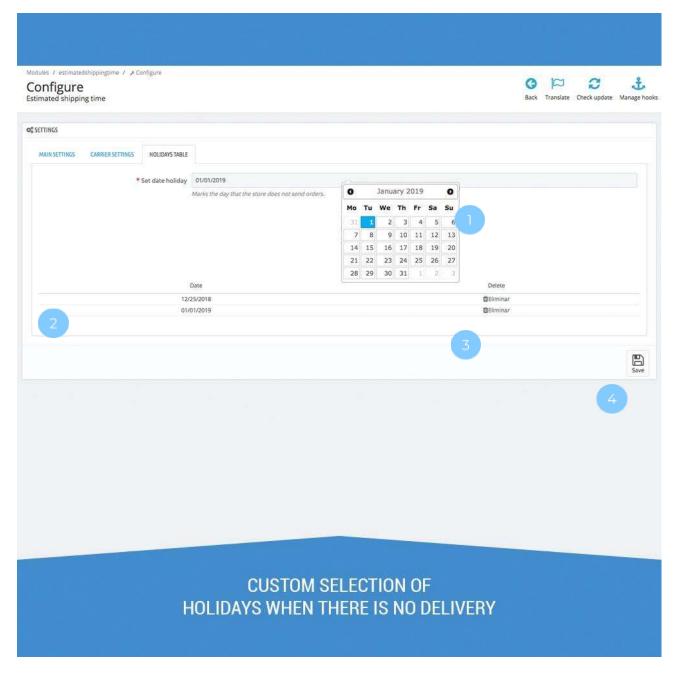

Then, in the "Carrier Settings" tab you can activate the advanced mode. If you enable this option, the module will take into account the configuration of each carrier when defining the delivery time. Remember to save this configuration.

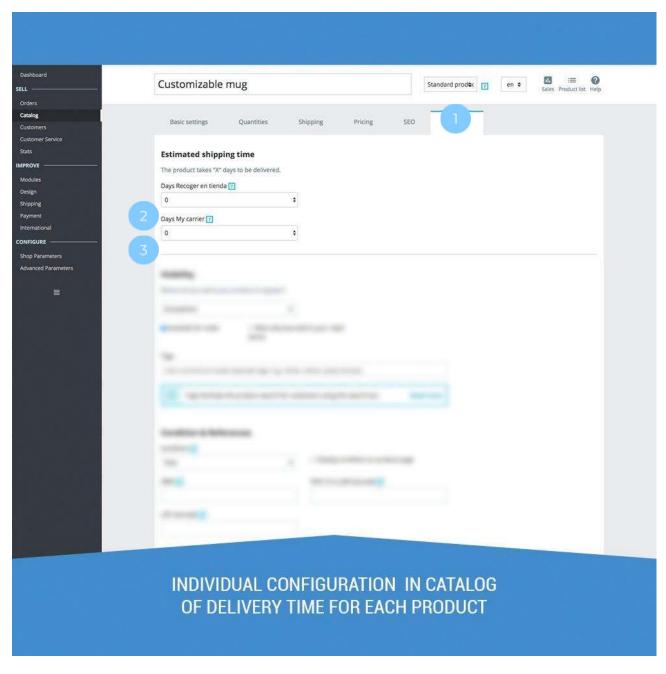

- 1. Enable the advanced mode to display the customized parameters for each carrier.
- 2. Here you can mark the days on which this carrier distributes.
- 3. For this carrier determine the predetermined days it takes to make a delivery.
- 4. Set here the maximum time at which this carrier collects the products in your store.
- 5. Activate this option to enable this carrier as an available option to your customers.
- 6. Save your custom parameters.

In the last configuration tab of the module, "Holiday Table", you can add or delete the days in which no distribution is made, with the objective that the module does not take them into account when counting the days it takes the delivery of the product.

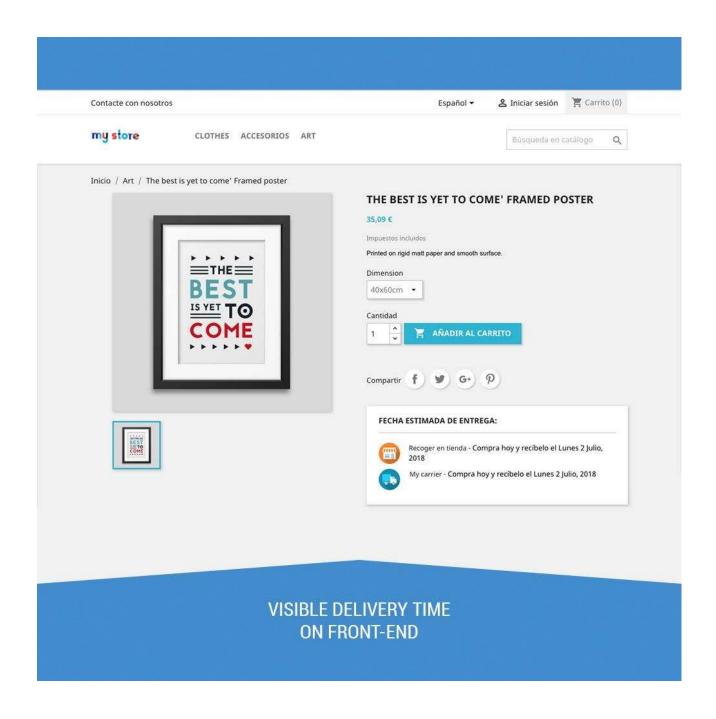

- 1. Click on this field to display the calendar and click on the day you wish to add as a holiday.
- 2. Below, you will see a table with all the days that you have marked as holidays.
- 3. Delete the ones you want by pressing "Delete".
- 4. Save this configuration.

Lastly and as previously specified, you can establish an individualized delivery time for each product. To do this, you simply have to access any product in your catalog and be located in the "Options" tab (indicated in point 1 of the lower screenshot). Here you will find the selectable parameters described below. Do not forget to save this configuration once you have finished.

- 2. Set here the working delivery days that the product will take to be available in the store. Leaving this value as 0, the time determined in the general configuration of the module will be applied (point 4 on page 5 of this manual).
- 3. Determine here the working delivery days that this product will take to be sent by this particular carrier. Remember that you can add more carriers in the general configuration section of the module (point 3 on page 5 of this manual). Leaving this value as 0, the same will happen as explained in the previous point.

Once activated and configured the module according to the previous steps, the delivery time for each carrier will be visible on the page of each product of your store, as shown below:

Notes to developers

This module does not modify any driver not involved in any critical process Prestashop.
